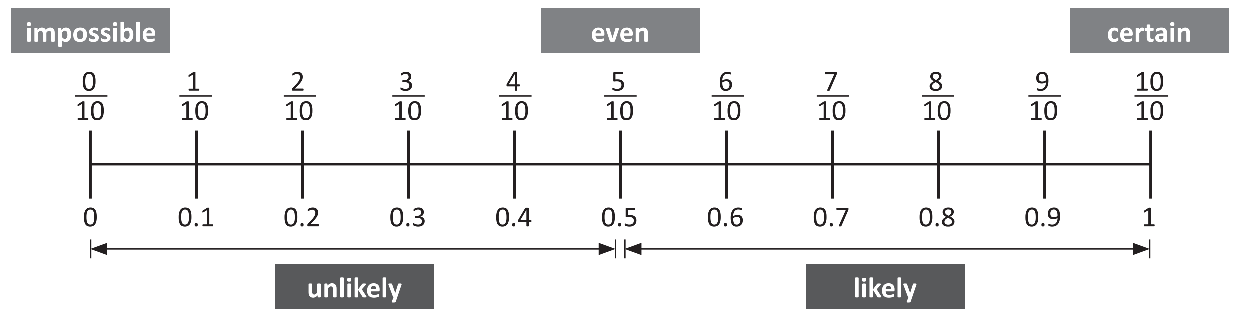
Chance and Probability

Name ____________

Chance and probability – probability scale

Probability measures how likely something is to happen.

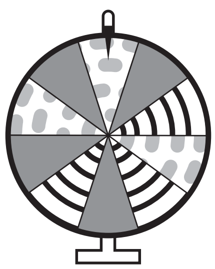


1 **Probability measures how likely something is to happen. Events that are certain to happen are given a probability of 1. Events that will never happen are given a probability of 0. Events that could happen are rated between 0 and 1.**

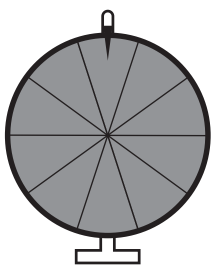
Event	Probability as a fraction	Probability as a decimal
When you flip a coin, it will land on heads.		
You will grow wings and fly today.		
A spinner with 10 even segments with the numbers 1 to 10 will land on 3.		
5 people are lined up and every second person in the line has gloves on. What is the chance that one person is not wearing gloves?		
You have 20 cards. 5 have hearts, 5 have stripes and the rest are blank. What is the chance you will choose a blank card?		

2 **What is the probability of spinning a striped segment on each of these wheels? Write your answer as a rating between 0 and 1 using decimals.**

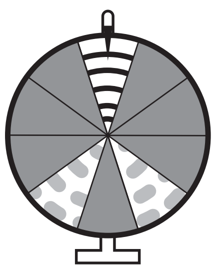
a



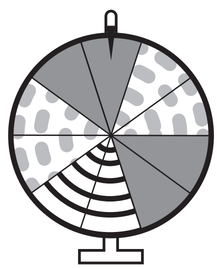
b



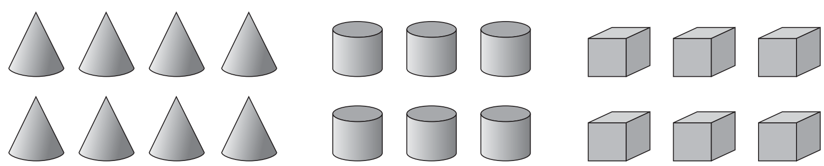
c



d



3 **Reuben is going to put ten blocks in a bag and ask a friend to choose one without looking. Circle the blocks he could put in the bag to make the probability of choosing a cube $\frac{2}{10}$.**



Chance and probability – probability scale

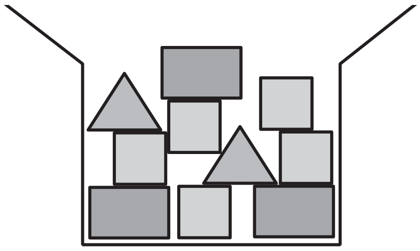
4 **100 guests each buy a ticket for a raffle at a fundraising dinner. The winning ticket will be selected at random. This table on the right shows the colours of all of the tickets in the raffle.**

Red	10
Purple	40
Orange	50
Total	**100**

What is the probability of the winning ticket being red, purple or orange? Draw arrows on this probability scale to show the probability of each colour and write the colour beneath the arrow.

0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1

5 **Inside a box there are 3 rectangles, 2 triangles and 5 squares. Without looking, Ellie chooses one shape from the box.**



a Draw each shape on this probability scale to show the probability of Ellie choosing each type of shape.

0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1

b 3 more rectangles, 2 more triangles and 5 more squares are added to the same box. Draw each shape on this probability scale to show the probability of Ellie choosing each shape from the box.

0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1

c What do you notice? ____

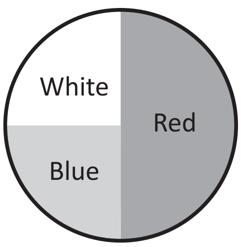
6 **Sam did an experiment with 10 cubes that were either red, white or blue. She took a cube from a jar without looking, tallied which colour it was then put it back in the same jar. She repeated the process 20 times. After tallying her results, she created this pie chart to show the results of the experiment.**

a How many times did Sam take each colour out of the jar? Remember she performed the experiment 20 times.

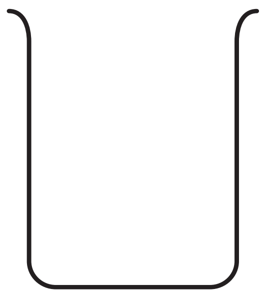
Red ☐

White ☐

Blue ☐



b Draw the combination of cubes there could have been inside the jar. Remember there are only 10 cubes.



Chance and probability – using samples to predict probability

Surveys are used to collect data about certain topics or questions. Once the data is collected, it is presented in a table so it is easy to understand. Surveys can be conducted to ask all kinds of questions.

We can use probability to see an even bigger picture than the survey tells us.
This table shows the data collected when 50 people were surveyed to find their favourite milkshake flavour.

Chocolate	Strawberry	Vanilla	Banana
19	16	8	7

We can use probability to predict the number of people who will choose each flavour in a larger survey.
When 100 people are surveyed, it is likely that chocolate will be the favourite milkshake flavour of 38 people.
When 1 000 people are surveyed, it is likely that chocolate will be the favourite milkshake flavour of 380 people.

1 **Faisal has had enough of selling clothes. If one more woman asks him, "Do I look fat in this?", he will scream. He holds a crazy closing down sale and sells the following items in 1 hour:**

Shirts	Jackets	Skirts	Dresses
18	14	7	3

Predict how many:

a jackets would sell in 2 hours

b skirts would sell in 2 hours

c shirts would sell in 3 hours

d dresses would sell in 4 hours

e shirts and jackets would sell in 4 hours

f items of clothing would sell in 8 hours

2 **Here is a table showing the results from a survey of 50 boys and 50 girls who were asked, "Which fruit do you like best?" Rate the probability that a person selected randomly will be:**

a a boy

b a girl who likes apples

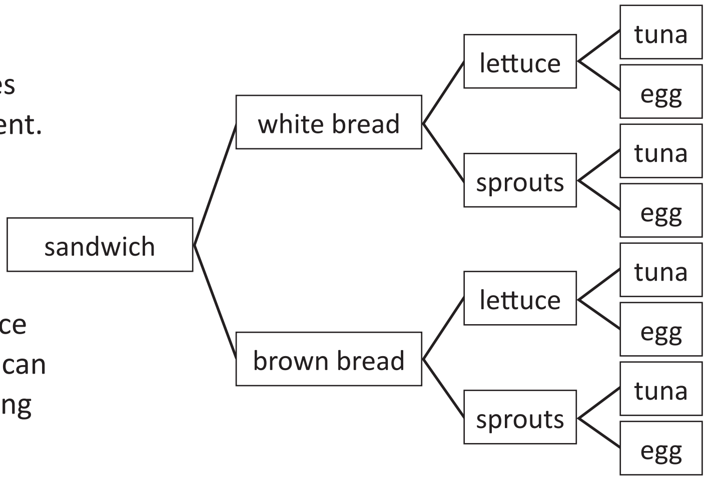
c someone who likes pears

	Girls	Boys
Apple	17	11
Banana	8	14
Orange	13	16
Pear	12	9

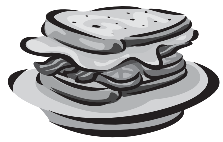
d Is the probability of someone choosing a banana greater than or less than $\frac{1}{2}$? ____________________

Chance and probability – tree diagrams

Tree diagrams are used to display all possible outcomes in a simple chance experiment. Here is an example: Matilda's father is making her lunch and has given her the following choice: white or brown bread, lettuce or sprouts, tuna or egg. We can then follow each branch along to see the different options.



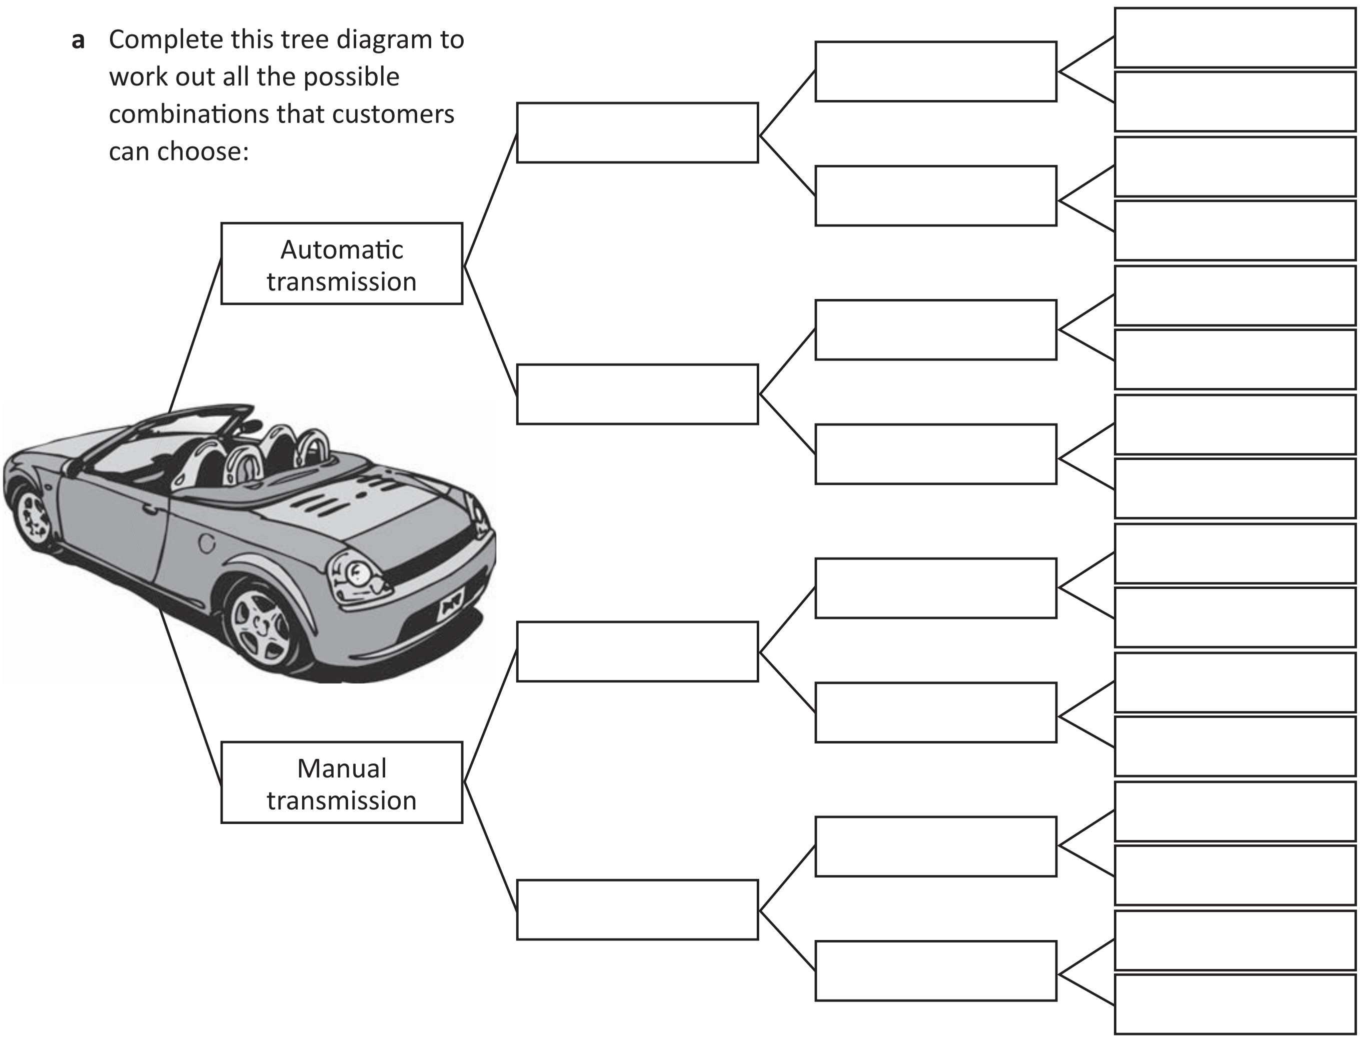
By using a tree diagram, we can see that Matilda has 8 different options for her sandwich.



1 **When customers buy a new car from Joe's Motors they can pay an additional cost for each of these optional extras:**

- **Alloy wheels instead of standard wheels**
- **Automatic transmission instead of manual transmission**
- **Metallic paint instead of standard paint**
- **Leather seats instead of standard seats**

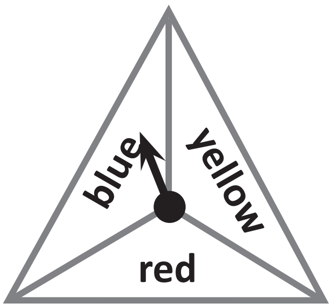
a Complete this tree diagram to work out all the possible combinations that customers can choose:



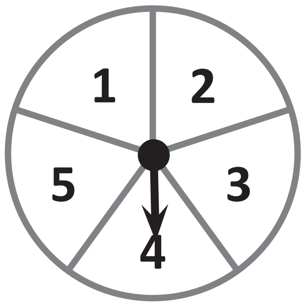
b How many possible combinations are there? ____

Chance and probability – chance experiments

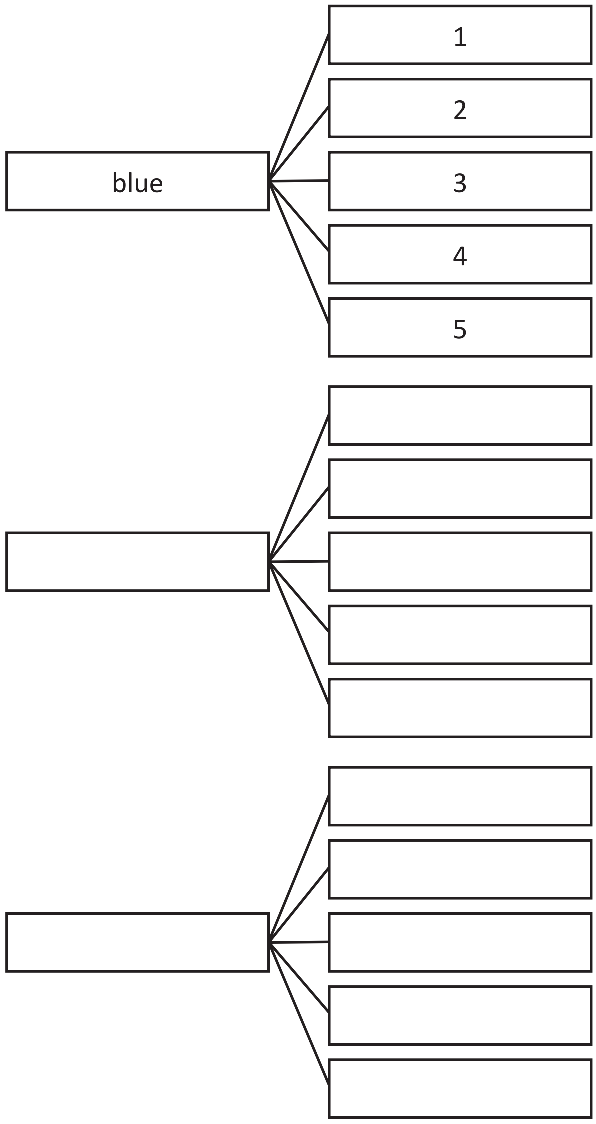
1 **Complete the tree diagram to show all the possible outcomes when you spin Spinner 1 and then Spinner 2. The first one is done for you.**



Spinner 1



Spinner 2



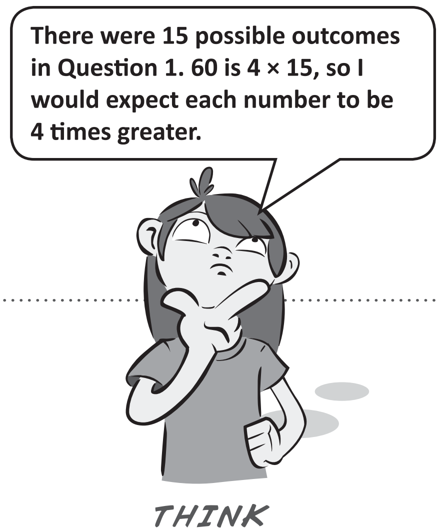
2 **What is the probability of landing on:**

a a yellow

b blue and 1

c a 4

d yellow and 3



3 **If you did this 60 times, how many times would you expect to get:**

a blue and 4

b a red

c a 1

d a 5

Chance and probability – using tables

When we work out all the possible outcomes of an event that could happen, we are finding out the theoretical probability. When we do the experiment and look at the probability of what actually happened, we call it experimental probability.

Theoretical probability is:

$$\frac{\text{number of favourable outcomes}}{\text{total number of possible outcomes}}$$

Experimental probability is:

$$\frac{\text{number of times the event occurred}}{\text{total number of trials}}$$

1 **When we roll 2 dice together, we can get a number of totals. Fill in this table to show the possible outcomes when 2 regular dice are rolled and added together:**

		Die 1					
	+	1	2	3	4	5	6
Die 2	1						
	2						
	3						
	4						
	5						
	6						

a How many different ways can the dice be rolled?

b Which total occurred the most often? Shade this in the grid.

c Which totals occurred the least often? Circle these on the grid.

2 **Graph the outcomes from the table above in the grid below.**
Express the theoretical probability of the following as a fraction:

2	3	4	5	6	7	8	9	10	11	12

Number of outcomes

Possible totals

a 7 = $\frac{\square}{\square}$ **b** 9 = $\frac{\square}{\square}$

c 2 = $\frac{\square}{\square}$ **d** 10 = $\frac{\square}{\square}$

3 **Now try this experiment. You will work with a partner and roll 2 dice 36 times. First make your predictions as to how often you will roll each answer. Write this in the first row. This is the _____________ probability. Now actually roll two die 36 times. In the bottom row, tally the number of times each total appears. This is the _________________ probability.**

Total	2	3	4	5	6	7	8	9	10	11	12
Number of times you expect to see each total											
Number of times you actually get each total											

4 **Look at the difference between the two rows. Is this what you expected?**

Now we are going to investigate the sample space of when the dice are different to regular dice. For this you will need 2 regular dice and some white stickers to stick over the sides of the dice.

5 **Cover 2 dice with white stickers so that the sides are covered on each die. Colour 4 of the faces yellow and colour 2 faces red:**

		Die 1					
Die 2	**+**	**Y**	**Y**	**Y**	**Y**	**R**	**R**
	Y	YY					
	Y						
	Y					YR	
	Y						
	R	RY					
	R						

a Complete the table to show the sample space.

b What are the chances of rolling 2 yellows? Colour the table to show this.

c What are the chances of rolling 1 yellow and 1 red?

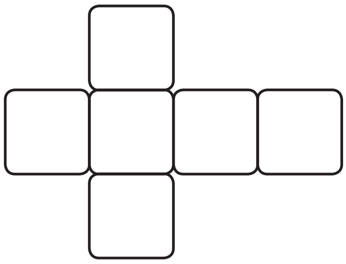
d What are the chances of rolling 2 reds?

6 **Look at the next table for the sample space of a set of dice.**

		Die 1					
Die 2	**+**	**Y**	**Y**	**G**	**G**	●	●
	Y	YY	YY	YG	YG	Y●	Y●
	Y	YY	YY	YG	YG	Y●	Y●
	G	GY	GY	GG	GG	G●	Y●
	G	GY	GY	GG	GG	Y●	Y●
	●						
	●						

a Complete the rest of the table to show the sample space.

b Show what one die looks like on this net of a cube.



c What is the chance of rolling:

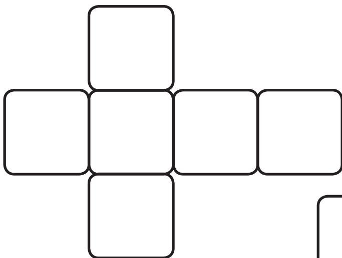
2 yellows?

2 dots?

7 **Make up your own crazy set of dice. Show the sample in the space on the left and show what they look like on the two nets of cubes on the right.**

		Die 1					
Die 2	**+**						

Die 1



Die 2
